Genetics in Otorhino-laryngology

Editors: **K. Kitamura, K.P. Steel**

How can genetics be useful to general otorhinolaryngologists and their patients? This book summarizes the most recent information on genetic diseases, including deafness, sinus disease and head-and-neck cancer, that is relevant to clinical practice, particularly with reference to accurate genetic counseling.

The first part of the volume presents a basic and general review of genetics. Up-to-date information on the deafness gene is given and the mouse model for hearing impairment is thoroughly described.

The application of molecular analysis of head-and-neck carcinoma has been one of the fundamental breakthroughs in understanding the cell biology of the carcinoma. Two chapters are devoted to the discussion of tumor suppressor genes and oncogenes.

This book is highly recommended since genetics, particularly molecular genetics, is still an unfamiliar subject to otorhinolaryngologists. Yet there is a constant need to be alert to the possibility of diagnosing hereditary disorders and to obtain genetic consultation for a complete evaluation. A comprehensive list of references is given for those who wish to find more detailed information.

Advances in Oto-Rhino- Laryngology

Series Editor
Arnold, W. (München)

Material for each volume in this series has been skillfully selected to document the most active areas of otorhinolaryngology and related specialties, such as neuro-otology and oncology. The series reproduces results from basic research and clinical studies pertaining to the pathophysiology, diagnosis, clinical symptoms, course, prognosis and therapy of a variety of ear, nose and throat disorders. The numerous papers correlating basic research findings and clinical applications are of immense value to all specialists engaged in the ongoing efforts to improve management of these disorders. Acting as a voice for its field, the series has also been instrumental in developing subspecialties into established specialties.
