

Improved Self-Archiving for Authors

Karger Publishers now allows post-print archiving of all accepted manuscripts and has been given SHERPA RoMEO green status.

Karger Publishers has further improved its services for authors and is pleased to announce an extension of its rules on self-archiving for authors. Authors may now archive their pre-prints (i.e. the original manuscript before peer review) or post-prints (the manuscript as finally accepted after peer review) on their personal or institution's servers upon request, provided these are non-commercial.

With this new rule, Karger goes well beyond the NIH requirements of depositing post-prints of NIH-funded papers at PubMed Central, making them freely available after 12 months. In a decision to treat all authors and research equally and simplify self-archiving, Karger now allows every author to deposit his article's post-print version on a non-commercial server, provided the document is not made publicly available for 12 months, a link to Karger's pdf version is provided and the publisher's copyright is acknowledged. Authors may not use the publisher's pdf version for self-archiving or deposit in PubMed Central.

While Karger has always allowed its authors to self-archive pre-prints on non-commercial servers, this new, modern approach gives the company SHERPA RoMEO green status and underlines our commitment to provide our authors with the highest standards of service and support.
