Karger Publishers – 125 Years of Experience in Medical and Scientific Publishing

Karger Publishers – independent, family-run and Swiss-based.

It is our goal to serve the global scientific community with innovative and outstanding publications in all fields of medical science. This means dedication to maintaining the highest standards of quality, as well as personalized service for authors, editors and readers.

Please order a free copy of the Karger Festschrift ‘Connecting the World of Biomedical Science’ by sending your address to 125years@karger.com.
Aims and Scope
Caries Research is an international journal, the aim of which is to promote research in dental caries and related fields through the publication of original research and the critical evaluation of research findings. The journal will publish papers on the etiology, pathogenesis, prevention and clinical control or management of dental caries. Papers on health outcomes related to dental caries are also of interest, as are papers on other disorders of hard tissues, such as dental erosion. Aspects of caries beyond the stage where the pulp ceases to be vital are outside the scope of the journal. The journal reviews papers dealing with natural products and other bacterial inhibitors that meet specific criteria, details of which are available from the Editor.

Submission
Only manuscripts written in English are considered and should be submitted using the online submission website: www.karger.com/crc. During the online submission you will be asked to list complete mailing addresses, including e-mail addresses of three potential reviewers for your manuscript. Copies of any 'in press' papers cited in the manuscript must accompany the submission. Manuscripts reporting on clinical trials must be accompanied by the CONSORT checklist (see below).

Plagiarism Policy
Whether intentional or not, plagiarism is always a serious violation. We would regard any paper that reproduces another work with at least 25% similarity and without citation as a case that meets our definition of plagiarism. If any evidence of plagiarism is found before/after acceptance of the paper for publication, the author will be offered a chance for rework. If the arguments are not found to be satisfactory, the manuscript will be retracted and the author sanctioned from publishing papers for a period to be determined by the responsible Editor(s).

Conditions
All manuscripts are subject to editorial review. Manuscripts are accepted with the explicit understanding that the data they contain have not previously been published (in any language) and that they are not under simultaneous consideration by any other publication. Submission of an article for publication implies the transfer of the copyright from the author to the publisher upon acceptance. Accepted papers become the property of Caries Research and may not be reproduced by any means, in whole or in part, without the written consent of the publisher. It is the authors' responsibility to obtain permission to reproduce illustrations, tables, etc., from other publications. Authors of papers describing research on human subjects are required to state that they have adhered to the Declaration of Helsinki.

Types of Papers
Original papers or Short Communications are reports of original work (including systematic reviews and meta-analyses). Both have the structure outlined below but for Short Communications the abstract should be less than 100 words and the manuscript should not exceed 3 printed pages, equivalent to about 9 manuscript pages (including tables, illustrations and references).

Reviews can have a freer format but should nevertheless commence with a title page, an Abstract and an Introduction defining the scope.

Current Topics are concise articles that present critical discussion of a topic of current interest, or a fresh look at a problem, and should aim to stimulate discussion.

Letters to the Editor, commenting on recent papers in the journal, are published occasionally, together with a response from the authors of the paper concerned.

Preparation of Manuscripts
One and a half line spacing with wide margins should be used throughout the text. All pages and all lines must be numbered, starting from the title page. A conventional font, such as Times New Roman or Arial, should be used, with a font size of 11 or 12. Avoid using italics except for Latin names of organisms and names of genes. Manuscripts should be prepared as a text file plus separate files for illustrations. The text file should contain the following sequence of sections: title page; Abstract; Introduction; Materials and Methods; Results; Discussion; Acknowledgements; References; Legends; Tables. Each section should start on a new page, except for the body of the paper (Introduction to Acknowledgements), which should be continuous. Lines in the manuscript must be numbered consecutively from the title page until the last page. Submissions which do not conform to these simple guidelines will be returned to the author.

Title page: the first page of each manuscript should show, in the following order:
- the title, which should be informative but concise;
- the authors’ names and initials, without degrees or professional status, followed by their institutes;
- a short title, maximum length 60 characters and spaces, for use as a running head;
- a list of 3–10 keywords;
- the name of the corresponding author and full contact details (postal address and email address).

Disclosure Statement: Potential conflicts of interest should be identified for each individual author and, if there are none, this should be stated explicitly. A conflict of interest arises when an author has a personal or financial relationship that might influence bias or affect their judgement. Examples of situations where a conflict of interest might arise include restrictive conditions in the funding of the research, or if an author or their employer holds patent(s) on a product used in the study, or if any payment is made to an investigator from organizations with an interest in the study (including employment, consultancy, honoraria, ownership of shares, travel grants). Investigators should disclose any potential conflicts to all study participants and should make a statement to confirm that they have done so.

The existence of a conflict of interest does not automatically preclude the consideration of a manuscript for publication, but the Editor might consider it appropriate to publish the information disclosed to him alongside the paper.

Abstract: The abstract should summarize the contents of the paper in a single paragraph of no more than 250 words (to ensure that the abstract is published in full by online services such as PubMed). No attempt should be made to provide detailed numerical results. References are not allowed in the abstract.

Introduction: This section should provide a concise summary of the background to the relevant field of research, introduce the specific problem addressed by the study and state the hypothesis to be tested.

Materials and Methods (or Subjects and Methods): All relevant attributes of the material (e.g. tissue, patients or population sample) forming the subject of the research should be provided. Experimental, analytical and statistical methods should be described concisely but include enough detail for others to be able to repeat the work.

The name and brief address details of the manufacturer or supplier of major equipment should be given. Statistical methods should be described in enough detail to allow a knowledgeable reader to replicate the analysis. Where applicable, a statistical test should be used to check the results of the analyses. Both have the structure outlined below but for Short Communications the abstract should be less than 100 words and the manuscript should not exceed 3 printed pages, equivalent to about 9 manuscript pages (including tables, illustrations and references).

Material and Methods should be described concisely but include enough detail for others to be able to repeat the work.

Randomized clinical trials should be reported according to the standardized protocol of the CONSORT Statement. The CONSORT checklist must be submitted together with all papers reporting observational studies in epidemiology. Reports on systematic reviews and meta-analyses should be structured to comply with the Preferred Reporting Items for Systematic Reviews and Meta-Analyses: The PRISMA Statement (http://www.prisma-statement.org/) and the PRISMA checklist must be submitted together with all papers reporting systematic reviews and meta-analyses.

The reporting of diagnostic accuracy studies should be carried out according to the criteria described in the Standards for Reporting of Diagnostic Accuracy (STARD) Statement (http://www.stard-statement.org/). The STARD checklist must be submitted together with all papers reporting diagnostic investigations which include clinical and/or laboratory measurements.

Randomized clinical trials must be registered at clinicaltrials.gov or a similar national authority and the trial number must be included in the manuscript. When submitting a paper on a clinical trial, the trial registration number should be stated at the end of the abstract using the following format: trial registration (name of the trial registry, the registry URL and the trial registration number).

In studies on laboratory animals, the experimental procedures should conform to the principles laid down in the European Convention for the Protection of Vertebrate Animals used for Experimental and other Scientific Purposes and/or the National Research Council Guide for the Care and Use of Laboratory Animals. Unless the purpose of a paper is to compare specific systems or products, commercial names of clinical and scientific equipment or techniques should only be cited in the Materials and Methods or Acknowledgements sections, as appropriate. Elsewhere in the manuscript generic terms should be used.
In any manuscript involving microradiography, the following must be included: the radiation source and filters used and the kV used (this determines the wavelength of radiation and hence the validity of using Angénier’s equation).

Manuscripts on experimental enamel caries should show that the lesions retain a relatively well-preserved surface layer, i.e. that they are not surface-softened lesions. Proof of surface integrity can be provided either as illustrations in the paper or as supplementary material for the reviewers. Transverse microradiography, polarized light microscopy of a section immersed in water or backscattered scanning electron microscopy of a polished cross section can be used to provide the necessary proof. To allow the nature of experimental changes to be assessed, microradiographs or micrographs should be provided to show part of the experimental lesion and the adjacent control enamel as shown by Zaura et al. 2007:41:489–492. Again, these images can be provided as part of the paper or as supplementary material for review purposes.

Results: Results should be presented without interpretation. Identical data should not be presented in both the tables and the figures. The text should not repeat numerical data provided in the tables or the figures but should indicate the most important results and describe relevant trends and patterns.

Discussion: This section has the function of describing the limitations of the material or the methods, of interpreting the data and of drawing inferences about the contribution of the study to the wider field of research. There should be no repetition of the preceding sections, e.g. reiteration of results or the aim of the research. The discussion should end with a few sentences summarizing the conclusions of the study. However, there should not be a separate Conclusions section.

Acknowledgements: The contribution of colleagues (for technical assistance, etc.) should be acknowledged and the position(s) of author(s) employed by commercial firms should be provided. This section should describe the source(s) of funding for the work and should cite any relevant grant numbers. Please also include this sentence: ‘The funders had no role in the study design, the data collection and the analysis, decision to publish, or the preparation of the manuscript.’ If this statement is not correct, you must describe the role of any sponsors or funders, and amend the sentence as needed. Additionally, the roles of all authors must be described. (For example: Conceived and designed the experiments: AA, BB. Performed the clinical examination: AA, CC. CC performed the experiments: DD, FF. Analyzed the data: BB, FF. Wrote the paper: AA, CC, FF, EE.)

Legends: The table headings should be listed first, followed by the legends for the illustrations.

Tables: Tables should be numbered in Arabic numerals. Each table should be placed on a separate page. The tables should not be constructed using tabs but should instead be compiled with the help of the table function of the word-processing software.

Illustrations:
- Illustrations should be numbered in Arabic numerals in the sequence of citation. Figure numbers must be clearly visible on the figures themselves, outside the image area.
- Black and white half-tone illustrations must have a final resolution of 300 dpi after scaling and line drawings should have a final resolution of 800–1,200 dpi.
- Figures with a screen background should not be submitted.
- Whenever possible, group several illustrations in a single block for reproduction (max. size 180 × 223 mm).

Color Illustrations

Online edition: Color illustrations are reproduced free of charge. In the print version, the illustrations are reproduced in black and white. Please avoid referring to the following sources: color material is included in the electronic version.

Print edition: Up to 6 color illustrations per page can be integrated within the text at CHF 960.00 per page.

References

Reference to other publications should give due acknowledgement to previous work, provide the reader with accurate information and guidance in the field of research under discussion, and it should also provide evidence to support the line of the arguments presented. Authors should select references carefully to fulfill these aims without attempting to be comprehensive. Cited work should already have been published or officially accepted for publication. Material submitted for publication but not yet accepted should be cited as ‘unpublished results’, while unpublished observations communicated to the authors by any other author should be cited as personal communication, with credit in both cases being given to the source of the information. Neither unpublished nor personally communicated material should be included in the list of references. Abstracts that are more than 2 years old and theses should not be cited without a good reason, which should be explained in the covering letter accompanying the paper.

References should be cited by naming the author(s) and the year. Where references are cited in square brackets, both names and figures are listed as square brackets. Where the authors are the subject or object of the sentence, only the year is enclosed in square brackets. First author: [Frostell, 1984] or Frostell [1984]. Two authors: [Dawes and ten Cate, 1990] or Dawes and ten Cate [1990]. More than two authors: [Trahan et al., 1985] or Trahan et al. [1985].

When several references are cited in square brackets, these should be in date order and separated by semicolons: [Frostell, 1984; Trahan et al., 1985; Dawes and ten Cate, 1990].

Material published on the World Wide Web should be cited in the same way as a reference to a print publication, and the URL should be included in the reference list (not in the text), together with the year when it was accessed. The reference list should include all the publications cited in the text, but no other publications. References, formatted as in the examples below, should be arranged in strict alphabetical order. All authors should be listed. For papers by the same authors, references should be listed according to the year. Papers published by the same authors in the same year should be distinguished by adding the letters a, b, etc. immediately following the year, in both the text citation and the reference list. For abbreviating the names of journals, use the Index Medicus system. For journals, provide only the year, the volume number, and the page numbers.

Examples

(b) Papers published only with DOI numbers: Theoharis TC, Boucher W, Spear K: Serum interleukin-6 reflects disease severity and osteoporosis in mastocytosis patients. Int Arch Allergy Immunol DOI: 10.1159/00006388.

‘A collection of extraordinary essays’

GOTTFRIED SCHATZ

A MATTER OF WONDER

What Biology Reveals about Us, Our World, and Our Dreams

Where do we come from? Is our destiny determined by the genes we inherit? In this book Gottfried Schatz, the world-renowned biochemist and co-discoverer of mitochondrial DNA, gives lucid – albeit often surprising – answers to universal questions and takes the reader on a fascinating journey of discovery across the boundaries of scientific disciplines. With passion and a keen sense of wonder he draws on philosophy, cultural history and art to formulate his reflections on the mysteries of life. His essays will appeal not only to scientists but to all inquisitive minds, regardless of educational and professional background.

G. Schatz (Basel)
A Matter of Wonder
What Biology Reveals about Us, Our World, and Our Dreams
Translated by A. Shields
XII + 190 p., 2 color fig., hard cover, 2011
CHF 29.– / EUR 21.50 / USD 29.00

Review

193 Matrix Metalloproteinases and Other Matrix Proteinases in Relation to Cariology: The Era of ‘Dentin Degradomics’
Tjäderhane, L. (Oulu); Buzalaf, M.A.R. (Bauru); Carrilho, M. (São Paulo); Chaussain, C. (Paris)

Original Papers

209 In vivo Scanning Electron Microscope Assessment of Enamel Permeability in Primary Teeth with and without Early Childhood Caries
Narrenthran, J.S.; Muthu, M.S.; Renugalakshmi, A. (Chennai)

216 Erosive Tooth Wear among 12-Year-Old Schoolchildren: A Population-Based Cross-Sectional Study in Montevideo, Uruguay
Alvarez Loureiro, L.; Fabraccini Fager, A. (Montevideo); Alves, L.S. (Santa Maria); Alvarez Vaz, R. (Montevideo); Maltz, M. (Porto Alegre)

226 Assessing Risk Factors for Dental Caries: A Statistical Modeling Approach
Trottini, M. (Alicante); Bossù, M.; Corridore, D.; Ierardo, G.; Luzzi, V.; Saccucci, M.; Polimeni, A. (Rome)

236 Enamel Formation Genes Associated with Dental Erosive Wear
Søvik, J.B. (Oslo); Vieira, A.R. (Pittsburgh, Pa.); Tveit, A.B.; Mulic, A. (Oslo)

243 Sour Sweets and Acidic Beverage Consumption Are Risk Indicators for Dental Erosion
Søvik, J.B.; Skudutyte-Rysstad, R.; Tveit, A.B.; Sandvik, L.; Mulic, A. (Oslo)

251 Association between Dairy Intake and Caries among Children and Adolescents. Results from the Danish EYHS Follow-Up Study
Lempert, S.M. (Copenhagen/Frederiksberg); Christensen, L.B. (Copenhagen); Froberg, K. (Odense); Raymond, K. (Frederiksberg); Heitmann, B.L. (Copenhagen/Frederiksberg/Sydney, N.S.W.)

259 In vitro Induction of Residual Caries Lesions in Dentin: Comparative Mineral Loss and Nano-Hardness Analysis
Schwendicke, F. (Berlin); Eggers, K. (Kiel); Meyer-Lueckel, H. (Aachen); Dörfer, C.; Kovalev, A.; Gorb, S. (Kiel); Paris, S. (Berlin)

266 Do Oral Health Conditions Adversely Impact Young Adults?
Carvalho, J.C. (Louvain); Mestrinho, H.D. (Brasilia); Stevens, S. (Louvain); van Wijk, A.J. (Amsterdam)

275 Association of Sweet Taste Receptor Gene Polymorphisms with Dental Caries Experience in School Children

282 Biomimetic Remineralization of Human Enamel in the Presence of Polyamidoamine Dendrimers in vitro
Chen, L. (Chongqing); Yuan, H.; Tang, B.; Liang, K.; Li, J. (Chengdu)

291 Oral Fluoride Levels 1 h after Use of a Sodium Fluoride Rinse: Effect of Sodium Lauryl Sulfate
Vogel, G.L.; Schumacher, G.E.; Chow, L.C. (Gaithersburg, Md.); Tenuta, L.M.A. (Piracicaba)
